---

# Disclosure

- No conflict of interest for this presentation

---

---

---

---

---

---

---

---

# Outlines

- Data acquisition
  - Spatial (Slice/Slab) selection
  - Spatial encoding (using frequency and phase)
- Image reconstruction
  - $K$ -space
  - Fourier Transform
- Signal-to-noise ratio
  - Signal intensity
  - Source of noise

### Chemical Shift Artifact

<http://mri-q.com/chemical-shift-artifact.html>

AAPM 2016 Chen Lin, PHD DABR 22

---

---

---

---

---

---

---

---

### Chemical Shift Artifact in SS-EPI

AAPM 2016 Chen Lin, PHD DABR 23

---

---

---

---

---

---

---

---

### Frequency and Phase Encoding

- Each encoded data point is a Fourier series.
- Frequency encoding
  - More efficient, no aliasing (using a low pass filter)
  - Frequency Encoding typically used in the direction of higher resolution or greater coverage
  - Chemical shift artifact (can be minimized with high RxBW)
- Phase encoding
  - More time consuming ( $N_{PE} * TR$ ), does improve SNR
  - Can be used more than once

AAPM 2016 Chen Lin, PHD DABR 24

---

---

---

---

---

---

---

---

### Spatial Selection & Encoding

- Heavily rely on the imaging gradients
  - Gradient non-linearity -> Spatial distortion
  - Gradient performance -> Acquisition time and min. FOV
  - Gradient stability -> Artifacts
- Any combinations of the three orthogonal physical gradients can be used for spatial selection or encoding

---

---

---

---

---

---

---

---

### K-SPACE AND FOURIER TRANSFORMATION

---

---

---

---

---

---

---

---

### K: Wave Number or Wave Index

# SIGNAL-TO-NOISE RATIO (SNR)

AAPM 2016      Chen Lin, PHD DABR      31

---

---

---

---

---

---

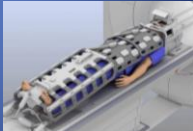

---

---

## Signal and Noise

- Proton Density (PD)
- Voxel size ( $\Delta x \Delta y \Delta z$ )
- Field Strength ( $B_0$ )
- Receiver coil sensitivity
- Sequence type and parameters
- Relaxation Properties.
- Averages (NEX)

- Patient / Object.
- Components (receiver coils & electronic components) in receiving chain.

AAPM 2016      Chen Lin, PHD DABR      32

---

---

---

---

---

---

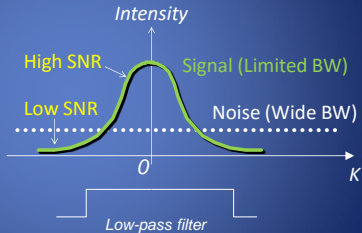

---

---

## Noise and $K$ -space filter

**Noise in MRI**

- Stochastic Process / thermal motion of electrons
- "White noise"

AAPM 2016      Chen Lin, PHD DABR      33

---

---

---

---

---

---

---

---

## Signal to Noise Ratio (SNR)

- SNR: Signal / Noise  
Signal: Average of pixel intensity (in a signal region)  
Noise: Fluctuation (Stdev) of pixel intensity (in a noise region)
- $SNR \sim f(\text{Sequence Type, FA, TR, TE, TI ...}) * PD B_0 \Delta x \Delta y \Delta z (N_{\text{phase}} * NEX / rBW)^{1/2}$
- Scan time =  $N_{\text{phase}} * NEX * TR$
- SNR Efficiency = SNR / Scan Time
- Contrast to Noise Ratio (CNR) =  $|S_{\text{Tissue1}} - S_{\text{Tissue2}}| / \text{Noise}$

AAPM 2016      Chen Lin, PhD DABR      34
