## Radiotherapy Outcomes

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## Reviews of Outcome Modelling in Radiotherapy

Kang, J., R. Schwartz, J. Flickinger, and S. Beriwal. 2015. "Machine Learning Approaches for Predicting Radiation Therapy Outcomes: A Clinician's Perspective." *Int J Radiat Oncol Biol Phys* 93 (5):1127-35.

El Naqa, I., J. D. Bradley, P. E. Lindsay, A. J. Hope, and J. O. Deasy. 2009. "Predicting radiotherapy outcomes using statistical learning techniques." *Phys Med Biol* 54 (18):S9-S30.

---

---

---

---

---

---

---

---

## What is Machine Learning?

Original concept based on the way that a human brain learns

- Algorithms designed to learn from the data
- No a priori knowledge of the relationship between the data
- Training using example cases
- Ability to generalise to unseen cases

---

---

---

---

---

---

---

---

## Unsupervised learning

Data grouped together using common features  
No reference made to corresponding output  
'Unlabelled data'

- Self organising maps (kohonen)
- Principal Component Analysis

Can be used for feature selection prior to a supervised learning approach

---

---

---

---

---

---

---

---

---

## Supervised learning

Algorithms trained to relate input features to output (outcomes)

'Labelled' data

Iterative training using cost function to find best model

- Support Vector Machines
- Random Forest
- Neural Networks

Used for classification & regression\*

---

---

---

---

---

---

---

---

---

## Common considerations (1)

Data splitting:

Cross validation

Bootstrapping (sampling with replacement)

**Independent** test set

TRIPOD guidelines

Moons et al Ann Intern Med 162:W1-73 (2015)

---

---

---

---

---

---

---

---

---

## Common considerations (2)

Assessment of results:

Receiver Operator Curve (ROC analysis)

Calibration Curves

Learning curves (bias/variance)

---

---

---

---

---

---

---

---

---

### Common considerations (3)

Curse of Dimensionality:

High order data becomes sparse in a multidimensional space

<http://www.visiondummy.com/2014/04/curse-dimensionality-affect-classification/>

---

---

---

---

---

---

---

---

---

### Common considerations (4)

Garbage in Garbage out:

Models are entirely dependent on the quality of the data

- Tumour/organ contouring consistency
- Intra/Inter fraction motion
- Adaptive planning
- Reporting of events using standardised scales
- Quality Assurance

---

---

---

---

---

---

---

---

---

### The curse of dimensions

Data stored as a jpeg  
3 dimensional array  
2816x2112x3

---

---

---

---

---

---

---

---

---

### The curse of dimensions

---

---

---

---

---

---

---

---

---

### The curse of dimensions

Data stored as

by 2112

---

---

---

---

---

---

---

---

---

### The curse of dimensions

---

---

---

---

---

---

---

---

## Radiotherapy Outcomes

---

---

---

---

---

---

---

---

## Dosimetry Features

---

---

---

---

---

---

---

---

### Challenges of modelling dose-volume effects

- Dose-volume relationship to toxicity is complex and not well understood
- Highly correlated data
- Toxicity related to a number of factors including dose-volume effects

---

---

---

---

---

---

---

---

## Challenges of modelling dose-volume effects

- Dose-volume relationship to toxicity is complex and not well understood
- **no a priori knowledge of model required**
- Highly correlated data
- **methods to deal with correlated data**
- Toxicity related to a number of factors including dose-volume effects
- **can include all types of data without knowing how the variables are related**

## Radiotherapy planning

21

---

---

---

---

---

---

---

---

## Patients

22

| Trial           | Number available | Primary disease site    | Radiotherapy technique         | Concurrent chemotherapy |
|-----------------|------------------|-------------------------|--------------------------------|-------------------------|
| PARSPORT        | 71               | Oropharynx, hypopharynx | Bilateral; Conventional, IMRT  | No                      |
| COSTAR          | 78               | Parotid gland           | Unilateral; Conventional, IMRT | No                      |
| Dose Escalation | 30               | Hypopharynx, larynx     | Bilateral; IMRT                | Yes                     |
| Midline         | 117              | Oropharynx              | Bilateral; IMRT                | Yes                     |
| Nasopharynx     | 36               | Nasopharynx             | Bilateral; IMRT                | Yes                     |
| Unknown Primary | 19               | Unknown primary         | Bilateral; IMRT                | Yes                     |

Dean et al Rad Onc 120 (2016) 21–27

---

---

---

---

---

---

---

---

---

---

## Toxicity scoring

23

| CTCAE toxicity          | Grade 1                | Grade 2            | Grade 3               | Grade 4   |
|-------------------------|------------------------|--------------------|-----------------------|---|
| Clinical oral mucositis | Erythema of the mucosa | Patchy ulcerations | Confluent ulcerations | Tissue necrosis; significant spontaneous bleeding |

Dose limiting toxicity  
Treatment interruptions

Dean et al Rad Onc 120 (2016) 21–27

---

---

---

---

---

---

---

---

---

---

## Toxicity scoring

24

- Prospectively measured at baseline, weekly during and 1, 2, 3, 4 and 8 weeks post-radiotherapy
- 351 patients with data available
- Patients with baseline toxicity excluded
- Peak grade < 3 vs  $\geq$  3
- Patients with missing data excluded
- **Final Dataset 183 patients**

Dean et al Rad Onc 120 (2016) 21–27

---

---

---

---

---

---

---

---

---

---

## Clinical data

25

- Age
- Sex
- Primary disease site
- Definitive radiotherapy vs postoperative radiotherapy
- Concomitant treatments
  - Induction chemotherapy
  - Concurrent chemotherapy regime (cisplatin/carboplatin/both)
- No smoking, alcohol or genetic data

Dean et al Rad Onc 120 (2016) 21–27

---

---

---

---

---

---

---

---

## Oral mucositis modelling

26

Grade 3 'Confluent ulceration'  
Oral cavity

Dose-volume histogram  
• fractional dose

Spatial features  
• 3D moment invariants

Dean et al Rad Onc 120 (2016) 21–27

---

---

---

---

---

---

---

---

## Spearman's Correlation Matrix

27

Dean et al Rad Onc 120 (2016) 21–27

---

---

---

---

---

---

---

---

## Penalised Logistic Regression

Logistic regression technique extended to mitigate for highly correlated data.

- Ridge Regression – some coefficients set to zero
- Least absolute shrinkage and selection operator LASSO regularisation. –coefficients reduced

---

---

---

---

---

---

---

---

## Random Forests

Ensembles of decision trees created and initialised using a randomly selected subset of the available data cases.

FIGURE 1 Pathways (left) and decision tree structure (right) for a classification tree model with three classes labeled 1, 2, and 3. The path probabilities are shown in the left side of the tree. The predicted class is given beneath each leaf node.

Loh, W. Y. 2011. "Classification and regression trees." *Wiley Interdisciplinary Reviews-Data Mining and Knowledge Discovery* 1 (1):14-23. doi: 10.1002/widm.8.

---

---

---

---

---

---

---

---

## Random Forests

The final result is aggregated from the contributions of each tree.

- outcome classification this will be the most votes (i.e.) class chosen by the most trees
- regression the outcome will be averaged across all the trees.

---

---

---

---

---

---

---

---

## Support Vector Machines

Classify data by translating variables in to a higher dimensional space where they are linearly separable

Ideally a boundary can be found that completely separates the two possible classes and maximises the distance between them.

Mapping achieved using a Kernel function

- Radial Basis function
- Polynomial function

---

---

---

---

---

---

---

---

## Support Vector Machines

Computationally intensive to solve however it is possible to characterise the prediction function using only a subset of training data (support vectors)

El Naqa et al Phys. Med. Biol. 54 (2009) S9–S30

---

---

---

---

---

---

---

---

## PLR – no spatial features

Dean et al Rad Onc 120 (2016) 21–27

---

---

---

---

---

---

---

---

## Random Forest – no spatial features

34

Dean et al Rad Onc 120 (2016) 21–27

---

---

---

---

---

---

---

---

## Results

Table 1 Performance of models on internal validation.

| Model                      | Hyper-parameters  | Mean AUC (s.d.) | Mean log loss (s.d.) | Mean Brier score (s.d.) | Mean calibration slope (s.d.) | Mean calibration intercept (s.d.) |
|----------------------------|---|-----------------|----------------------|-------------------------|-------------------------------|-----------------------------------|
| PLR <sub>Generalized</sub> | Regularization = LASSO, C = 0.1                         | 0.72 (0.08)     | 0.66 (0.03)          | 0.23 (0.02)             | -                             | -3.0 (3.2)                        |
| SVC <sub>Generalized</sub> | Kernel = radial basis function, C = 0.1, gamma = 0.01   | 0.72 (0.09)     | -                    | -                       | -                             | -1.5 (1.4)                        |
| RFC <sub>Generalized</sub> | Max depth = 5, max features = square root               | 0.71 (0.09)     | 0.56 (0.08)          | 0.19 (0.03)             | 3.9 (2.2)                     | -4.8 (3.2)                        |
| PLR <sub>Generalized</sub> | Regularization = LASSO, C = 0.1                         | 0.72 (0.09)     | 0.66 (0.04)          | 0.23 (0.02)             | 11.9 (10.9)                   | -                                 |
| SVC <sub>Generalized</sub> | Kernel = radial basis function, C = 1.0, gamma = 0.0001 | 0.71 (0.09)     | -                    | -                       | -                             | -                                 |
| RFC <sub>Generalized</sub> | Max depth = 5, max features = square root               | 0.70 (0.09)     | 0.56 (0.07)          | 0.18 (0.03)             | 4.2 (2.3)                     | -1.9 (1.6)                        |

PLR – penalized logistic regression; SVC – support vector classification; RFC – random forest classification; s.d. – standard deviation; C – inverse regularization strength.

Spatial information did not improve predictive performance

Dean et al Rad Onc 120 (2016) 21–27

---

---

---

---

---

---

---

---

## Representing Dose distribution using dose surface Maps

3D dose distribution

Rectal Dose Surface Map

---

---

---

---

---

---

---

---

### Using dose-surface maps to predict radiation-induced rectal bleeding: a neural network approach

Florian Buettner, Sarah L Gulliford, Steve Webb and Mike Partridge  
Joint Department of Physics, Institute of Cancer Research and Royal Marsden NHS Foundation Trust, Sutton, Surrey SM2 5PT, UK

---

---

---

---

---

---

---

---

### Artificial Neural Network

Input layer    Hidden layer    Output layer

Weighted sum on each node  $\sum_i w_{ij}$   
Non linear activation function  
Backpropagation of errors

---

---

---

---

---

---

---

---

### Dose surface map ANN architecture

locally connected NN  
2 hidden layers  
a-c) individualised weights  
  
d) shared weights  
  
2 output nodes

Buettner et al Phys. Med. Biol. 54 (2009) 5139–5153

---

---

---

---

---

---

---

---

## Ensemble Learning

Ensemble learning incorporates groups of neural networks each with different starting conditions and selected subset of training data sets  
250 NN initialised. Results aggregated

### Expert ensemble

Results of each NN are assessed and if they improve the performance of the ensemble they are "voted in".

Buettner et al Phys. Med. Biol. **54 (2009) 5139–5153**

## Patients

Prostate cancer UK-MRC RT01 trial

Compared 64Gy vs 74Gy (circa 1998-2001)

388 patients with data

Used to predict rectal bleeding  $\geq$  Grade 2

(RMH score) simple outpatient management/transfusion

Patients with baseline toxicity excluded

**329 patients 53 patients with G2 Rectal Bleeding**

Buettner et al Phys. Med. Biol. **54 (2009) 5139–5153**

## Results

Table 3. Performances of all locally connected nets.  $AUC_{all}$  denotes the AUC calculated from all nets in the ensemble and  $AUC_{exp}$  the AUC derived from the experts only.

| Architecture | No of hidden and output nodes | No of weights and biases <sup>a</sup> | $AUC_{all}$ | $AUC_{exp}$ |
|--------------|-------------------------------|---------------------------------------|-------------|-------------|
| 1            | 312                           | 1442                                  | 0.57        | 0.57        |
| 2            | 111                           | 1173                                  | 0.61        | 0.64        |
| 3            | 58                            | 562                                   | 0.59        | 0.62        |
| 4            | 492                           | 964                                   | 0.56        | 0.57        |

<sup>a</sup> The number of unique weights and biases was calculated by adding up the unique connections between the nodes:  $1442 = 210 \times 3 + 100 \times 3 + 2 \times 100 + 312$ ,  $1173 = 100 \times 9 + 9 \times 16 + 2 \times 9 + 111$ ,  $562 = 49 \times 9 + 7 \times 7 + 2 \times 7 + 58$ ,  $964 = 4 \times 9 + 16 \times 4 + 32 \times 6 + 2 \times 90 + 492$ .

Compare results with fully connected NN using DSH data  
AUC 0.59

Buettner et al Phys. Med. Biol. **54 (2009) 5139–5153**

---

### Why such a low AUC?

- Incomplete characterisation of spatial information
- Model architecture
- Inter & Intra fraction rectal motion/filling
- Only dosimetry in the model

#### What's missing?

- Clinical factors (age, diabetes etc)
- Other therapies (hormones)
- Genetic variants(SNPS)

---

---

---

---

---

---

---

---

---

### Why don't we use Machine Learning more?

Reputation mystical black box

Wide variety of techniques (which approach is appropriate?)

The road less trodden

---

---

---

---

---

---

---

---

---

### Summary

- Evidence that Machine Learning approaches are complimentary to traditional statistical techniques and each other.
- Data hungry: more variables need more datasets
- Require rigorous methodology and independent validation

---

---

---

---

---

---
