

# Mitigation of irregular respiration in cine 4DCT

Tinsu Pan Ph.D.

M.D. Anderson Cancer Center  
The University of Texas

---

---

---

---

---

---

---

---

## Outlines

- Review of cine 4D-CT
- Issues with irregular respiration
- Mitigation of irregular respiration in cine 4D-CT
- Summary

---

---

---

---

---

---

---

---

## FB helical CT data acquisition

---

---

---

---

---

---

---

---

### Breathing Artifacts

Protocol: 16 × 0.625 mm, 0.8 s gantry rotation, pitch 1.375  
Speed: 13.75 mm/0.8 s or 17.2 mm/s

---

---

---

---

---

---

---

---

---

---

### Artifacts to physiological info

Breath cycle= 80.3/(13.75/0.8)= 4.67 s  
Heart rate= (21/(13.75/0.8))<sup>-1</sup> × 60= 49 bpm

---

---

---

---

---

---

---

---

---

---

### Cine 4D-CT workflow

---

---

---

---

---

---

---

---

---

---

### Cine CT acquisition

---

---

---

---

---

---

---

---

### Cine 4D-CT Protocol

- 4, 8 or 16 slices of 2.5 mm per rotation
- Scan duration = breathing cycle + 1 sec
- Ensure RPM is recording the respiratory waveform
- Start cine CT scan (2 to 3 min)
- Dose is < 50 mGy for chest and < 75-100 mGy for abdomen

---

---

---

---

---

---

---

---

### Motion phantom experiment

4 sec cycle and 2 cm peak to peak motion

---

---

---

---

---

---

---

---

## Effect of 4D gating on phantom imaging

Gating preserves the shape and size of the object

---

---

---

---

---

---

---

---

---

---

## 4D-CT patient study with contrast

---

---

---

---

---

---

---

---

---

---

## Effects of 4D-CT on implantable defibrillator and pacemaker

---

---

---

---

---

---

---

---

---

---

## Effects of CT Irradiation on Implantable Cardiac Rhythm Management Devices<sup>1</sup>

Radiotherapy

Cynthia H. McCullough, PhD  
Jin-Dang, PhD  
Andrew N. Pinski, PhD  
Wesley J. Chenert, BSCE  
John H. Sauer, PhD

**Purpose:** To prospectively measure the response of a variety of models of implantable cardiac rhythm management devices (ICRMDs) to the radiation delivered by computed tomography (CT), for both maximum and typical dose levels.

Maximum Dose

Typical Dose

**Conclusion:** CT irradiation at typical clinical doses results in oversensing of ICRMDs in the majority of devices tested, although the identified effects were predominantly transient.

---

---

---

---

---

---

---

---

---

---

## 4D-CT patient

23.4 mGy/s dwell time of 5.05 s

---

---

---

---

---

---

---

---

---

---

## 4D-CT induced interference

The duration of interference was exactly identical to the duration of cine CT scan duration.

Attention should be to pacing dependent patient.

Pan et al, J. Nuc. Card. 2018

---

---

---

---

---

---

---

---

---

---

## Artifacts of 4D-CT

---

---

---

---

---

---

---

---

### Basic assumptions of 4D-CT

- Data acquisition for at least one breath cycle per table position
- Patient breaths regularly.

Irregular breathing

Under-sampling

---

---

---

---

---

---

---

---

### Two consecutive 4D-CT scans

First scan

Second scan

Image quality was degraded in long imaging session

---

---

---

---

---

---

---

---

*Ensure correct phase selection*

Pan et al. Med Phys. '07

---

---

---

---

---

---

---

---

---

---

*Incorrect ID of end-inspiration phases*

---

---

---

---

---

---

---

---

---

---

*Correct ID of end-inspiration phases*

---

---

---

---

---

---

---

---

---

---

### 4D-CT (phase sorting issue)

Artifact caused by irregular respiration

---

---

---

---

---

---

---

---

---

---

### Solutions for mitigating artifacts

- Acquisition of more than two respiratory cycles
  - Additional time for data selection and more radiation to patient
- Repeat acquisition of the positions with irregular respiration
  - Additional tool for merging the data of regular respiration and more radiation to patient
- Repeat the 4DCT study
  - Repeat scan may not be better than the first scan and more radiation to patient
- Prospective gating, i.e., acquisition of only the regular data
  - Keall et al in 2007

---

---

---

---

---

---

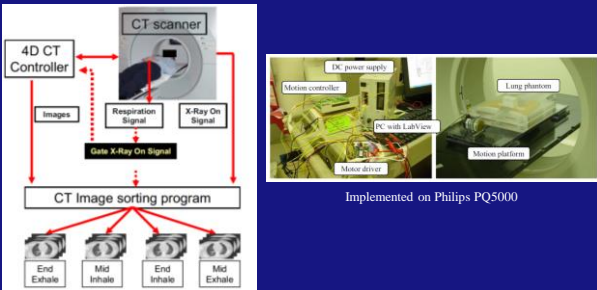

---

---

---

---

### Prospective 4D-CT on Single-slice CT

---

---

---

---

---

---

---

---

---

---

# Prospective cine 4D-CT (w/o hardware and software)

**IOP Publishing** | Institute of Physics and Engineering in Medicine | Physics in Medicine & Biology

---

---

---

---

## Observation

---

---

---

---

---

---

---

---

## Identification of irregular respiration 1

---

---

---

---

---

---

---

---

## Identification of irregular respiration 2

---

---

---

---

---

---

---

---

## Phantom Experiment

Irregular respiration in conventional 4D-CT

Skip irregular respiration in Prospective 4D-CT

---

---

---

---

---

---

---

---

## Prospective 4D-CT (1)

End inspiration

End expiration

End inspiration with irregular respiration

---

---

---

---

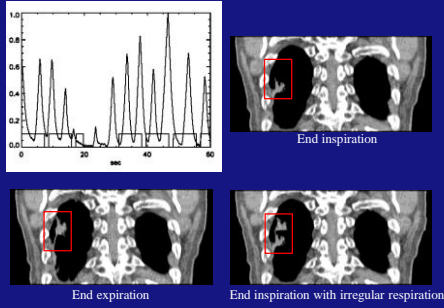

---

---

---

---

### Prospective 4D-CT (2)

---

---

---

---

---

---

---

---

---

---

### Retrospective reconstruction to remove the images of irregular respiration

Retro	Scan Type	Retro Start	Retro End	No. of Images	Thick (mm)	Interval	Time
V	Chw Full 0.5 sec	140.000	197.500	96	8 x 2.5	0.500	0.0 6.0
V	Chw Full 0.5 sec	140.000	177.500	96	8 x 2.5	0.500	0.0 6.0
H	Chw Full 0.5 sec	180.000	197.500	32	8 x 2.5	0.500	0.0 2.1
V	Chw Full 0.5 sec	180.000	197.500	96	8 x 2.5	0.500	0.0 6.0

---

---

---

---

---

---

---

---

---

---

### Steps of prospect cine 4D-CT

- Stop acquisition during irregular respiration
- Resume acquisition when regular respiration
- Remove incomplete data in retrospective reconstruction
- Repeat as many times as needed
- Not applicable to helical 4D-CT
  - Once the scan is stopped, it can not be resumed.

---

---

---

---

---

---

---

---

---

---

### *Summary*

- 4D-CT scans can interfere with the function of defibrillator or pacemaker. Attention should be to pacing dependent patient.
- Prospective cine 4D-CT can be implemented to help reduce artifacts without cost.
