

# Immunotherapy Killed the IGRT Star: Integrating Radiotherapy Into Systemic Therapy for **Metastatic** Disease

Steven J. Chmura MD, PhD  
Associate Professor  
Director of Clinical and Translational Research  
University of Chicago

---

---

---

---

---

---

---

---

## Disclaimer

- **Spouse:** Medical Oncologist & Medical Director for Oncology Products at Astellas Pharmaceutical
- Reflexion Medical Systems

---

---

---

---

---

---

---

---

## 40 Minute Outline

- Expanding the role of radiotherapy for:
  - Local therapy for **Limited** (Oligometastatic) Disease
- What is immunotherapy? A Primer
- Can Radiotherapy Enhance Immunotherapy?
  - Local Therapy for **Widespread** Disease (polymetastatic) with Immunotherapy be a new paradigm?

---

---

---

---

---

---

---

---

## Radiotherapy for metastatic Disease

---

---

---

---

---

---

---

---

### The Clinical Problem of Metastasis

- Metastasis accounts for 85-90% of cancer mortality
- Regarded as *widely disseminated* and *incurable* in adult solid tumors
- Treated with *systemic* therapies: *usually not curative*

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Overarching Clinical Question:

*How can we cure more patients with metastatic disease?*

---

---

---

---

---

---

---

---

### Oligometastasis Hypotheses and Characteristics

- Metastasis represents a *spectrum* of disease: number of metastases/organs involved/pace of progression
- Subsets of patients with limited (oligometastatic) disease are *potentially curable* with *metastasis-directed therapies (SBRT)*
- Cytoreduction* with could synergize with systemic agents to improve outcomes

---

---

---

---

---

---

---

---

### Spectrum of Metastatic Disease

Limited Spread (Oligometastasis)  
**1-5 Metastases**

Widely Disseminated (Polymetastases)

---

---

---

---

---

---

---

---

Pubmed Results: Interest in Oligometastasis over time

---

---

---

---

---

---

---

---

Pubmed Results: Interest in Oligometastasis over time

---

---

---

---

---

---

---

---

What have we learned?

---

---

---

---

---

---

---

---

Oligometastases exist and are common

Many claim to see them....

Oligometastatic Patients Exist... Breast Cancer

**Table 1. Frequency of Patients Enrolled on First-Line Metastatic Breast Cancer Trials With a Limited Number of Metastatic Sites Who Appear Potentially Eligible for Ablative Therapy**

First Author	Phase	n	ER/PR+ (%)	HER2 <sup>+</sup>	≤ 2 Met sites (%)	≤ 4 Met Sites (%)	Arms	PFS (mo)
Alban 2008 <sup>14</sup>	II	599	32	—	57	91	1. Gem + Paclitaxel	9.89
Bergh 2012 <sup>15</sup>	III	593	72	Pos	52	—	2. Paclitaxel	8.4
							1. Sunitinib + Docetaxel	8.6
							2. Docetaxel	8.3
Tawfik 2013 <sup>16</sup>	II	30	77	Neg	50	—	1. Vinorelbine, capecitabine	8.6*
Huntz 2013 <sup>17</sup>	III	137	54	Pos	49.3	—	1. Trastuz + Docetaxel	9.2
							2. T-DM1	14.2
Gianni 2013 <sup>18</sup>	III AVEREL	424	51	Pos	30	—	1. Docetaxel+ Trastuz	13.7
							2. Docet + Tris + BEV	16.5
Sledge 2003 <sup>19</sup>	III E1193	739	45	—	49	—	1. Doxorubicin	6*
							2. Paclitaxel	6.3
							3. Doxorubicin + Paclitaxel	8.2

\* Time to failure.  
Abbreviations: ER/PR, estrogen receptor/progesterone receptor; met sites, metastatic sites; PFS, progression-free survival; Pos, positive; Neg, negative; Gem, gemtacinib; T-DM1, trastuzumab emtansine; Docet, docetaxel; Tris, trastuzumab; BEV, bevacizumab.

50% have <4 sites of metastases at diagnosis

**NRG-BR001**  
ClinicalTrials.gov NCT02206334  
**A Phase 1 Study of Stereotactic Body Radiotherapy (SBRT) for the Treatment of Multiple Metastases**

- Hypothesis: 3-4 or 2 anatomically close metastases can be safely treated with established SBRT doses
- Primary Objective: To determine the recommended SBRT dose for each of the metastatic locations
- Inclusion: Metastatic NSCLC, Breast and Prostate patients
- Sample size: 42-84 patients

COMPLETED ACCRUAL 4/2018 [1]

Metastatic Locations	BED >100	
	Prescription Doses	Initial Starting Dose
Lung—Peripheral	45 Gy	
	(3 fractions)	
Lung—Central	30 Gy	
	(5 fractions)	
Mediastinal/Cervical Lymph Node	50 Gy	
	(5 fractions)	
Liver	45 Gy	
	(3 fractions)	
Spinal/Paraspinal	30 Gy	
	(3 fractions)	
Osseous	30 Gy	
	(3 fractions)	
Abdominal-pelvic metastases (lymph node/adrenal gland)	45 Gy	
	(3 fractions)	

---

---

---

---

---

---

---

---

---

---

**Protocol Specified DLTs - None**

Metastatic Location	#Enrolled for DLT Assessment	#Evaluable for DLT Assessment	#DLTs
Bone/Osseous Starting Dose	8	6	0
Spinal/Paraspinal Starting Dose	7	6	0
Peripheral Lung Starting Dose	7	6	0
Abdominal-pelvic Starting Dose	9	7 <sup>†</sup>	0
Central lung Starting Dose	8	7 <sup>†</sup>	0
Liver Starting Dose	9	5	0
Mediastinal/Cervical Starting Dose	7	6	0

†The DLT analysis was based on the first 6 of these 7 patients.

---

---

---

---

---

---

---

Targeting The ICE: Immune Checkpoints in the Tumor Microenvironment

---

---

---

---

---

---

---

---

---

---

How Does Immunotherapy Work?

Tumor cells bind to T-cells to deactivate them

Immunotherapy drugs can block tumor cells from deactivating T-cells

---

---

---

---

---

---

---

---

---

---

### Targeting PD-L1: Our best target so far

---

---

---

---

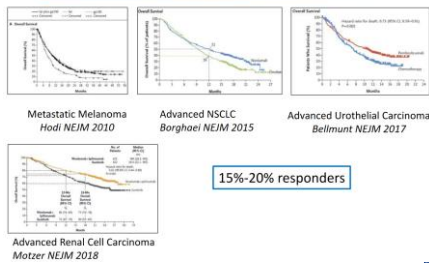

---

---

---

---

### Immunotherapy (PD-L1) works

---

---

---

---

---

---

---

---

### Immune System Background Summary

- o Immune system balancing attack (Fire/Hot) with Suppression (Cold)
- o Immune system has innate (nonspecific) and adaptive (specific) elements
- o The persistence of cancer leads to immune dysfunction and Exhausting T-Cells that mount the response!
- o Immune checkpoints and features of tumor microenvironment are targets for drug development

---

---

---

---

---

---

---

---

### Does the Immune System Augment Stereotactic Body RadioTherapy (SBRT)?

---

---

---

---

---

---

---

---

### Radiation-Induced Equilibrium Is a Balance between Tumor Cell Proliferation and T Cell-Mediated Killing

**Radiation-Induced Equilibrium Is a Balance between Tumor Cell Proliferation and T Cell-Mediated Killing**

J Immunol 2013; 190:5876-5881. Prepublished online 29 April 2013.  
DOI: 10.1093/immunol/1202612

**RT-induced dormancy can relapse years later**

---

---

---

---

---

---

---

---

### Radiation-Induced Equilibrium Is a Balance between Tumor Cell Proliferation and T Cell-Mediated Killing

---

---

---

---

---

---

---

---

Radiation-induced tumor equilibrium (RITE) is a balance between cell birth (Ki67 positive), and cell death (TUNEL positive), mediated principally by CD8<sup>+</sup> T cells.

Apoptosis co-localized with CD8<sup>+</sup> cells in Stable Tumors

Randomized phase II study of anti-PD-1 alone vs. anti-PD-1+SBRT in patients with **advanced NSCLC** (n=64)

Figure 1. Progression-free Survival

Median PFS is 7.3m (95% CI 4.5 - NA) in the experimental arm and 2.8m (95% CI 1.7 - 7.8) in the control arm. HR 0.41 (95% CI 0.20 - 0.86, p = 0.006)

Median OS is 13.2m (95% CI 7.3-NA) in the experimental arm and 7.6m (95% CI 6-13.9) in the control arm. HR 0.58 (95% CI 0.31-1.1, p = 0.1)

•Median PFS was **1.8** months in the PD-1 alone arm vs **6.4** months in the PD-1+SBRT arm

AAPM 2019

---

---

---

---

---

---

---

---

### Disease Burden Impacts Response

Figure 2. Kaplan-Meier estimates of OS by tumor size at baseline.

Numbers at risk

Below median	183	177	162	153	132	103	55	44	19
Above median	182	151	121	104	82	60	24	16	5

Melanoma cohort of Keynote-001

Joseph et al. Presented at ASCO 2014

---

---

---

---

---

---

---

---

---

---

### Who responds **BEST** to immunotherapy?

Immunologically **“Hot”** or **“Inflamed”** tumors

- Patients with small volume disease
- Tumors that are PDL-1 positive
- Tumor with high mutational burden

---

---

---

---

---

---

---

---

---

---

Hypothesis: **Potentiation** of Immunotherapy and combination w/RT

- **Potentiation** of immunotherapy and combination with XRT **produce T-cell inflamed phenotype “HOT”**
- **Cytoreduction** → **relieve** immune suppression and **overcome heterogeneity**

Treatment Related Severe Dose-Limiting Toxicity (DLTs) by Anatomic Cohort

	Anatomic Cohort							Total
	Lung-Peripheral	Lung-Central	Med/Thoracic	Liver	Spinal	Osseous	Abd/Pelvic	
Dose limiting toxicity events (ratio)	1/12	2/11						
Toxicity for cohort patients evaluable at 3 months (ratio, percent)	1/12 (8.3%)	2/10 (20.0%)						6/62 (9.7%)

**6/73**

- Median follow-up for treatment-related toxicity: 3.1 months
- 62 patients with at least 3 months of follow-up
- All pts who experienced DLTs were evaluable
- 3/6 had both lesions in the same anatomic locations and 3/6 pts had lesions treated in separate anatomic locations

**-No SBRT dose reductions**

## Results

Characteristic	Complete-Rx (116 Mets)	Partial-Rx (21 Mets)
<b>Treated Metastasis Location</b>		
Abdomen/Pelvis	17 (14.4%)	9 (42.9%)
Liver	12 (10.2%)	8 (38.1%)
Lung-Central	21 (17.8%)	2 (9.5%)
Lung-Peripheral	30 (25.4%)	0 (0.0%)
Mediastinum/Cervical	14 (11.9%)	1 (4.8%)
Osseous	12 (10.2%)	0 (0.0%)
Spinal	12 (10.2%)	1 (4.8%)
Largest Treated Tumor Volume (cubic ccs), Mean (SD)	12.8 (14.8)	157.6 (95.7)
Dose to OARs (Minimum BED <sub>2</sub> ), Mean (SD)	222.8 (93)	42.4 (59.3)
Dose to Tumor (Minimum BED <sub>10</sub> ), Mean (SD)	95.0 (35.3)	23.8 (25.8)

## Results

Characteristic	Complete-Rx (118 Mets)	Partial-Rx (21 Mets)
Largest Treated Tumor Volume (cubic ccs), Mean (SD)	12.8 (14.8)	157.6 (95.7)
Dose to OARs (Minimum BED <sub>2</sub> ), Mean (SD)	222.8 (93)	42.4 (59.3)
Dose to Tumor (Minimum BED <sub>10</sub> ), Mean (SD)	95.0 (35.3)	23.8 (25.8)

## Results: Treated Metastasis Control (TMC)

- 1-yr TMC – 89.5%
- **No difference between Complete-Rx vs Partial-Rx Despite:**
  - V95% of 67.2% (Partial-Rx) vs 100% (Complete-Rx)
  - Minimum BED<sub>10</sub> of 23.8 Gy (Partial-Rx) vs 95.0 Gy (Complete-Rx)

## Conclusions

- SBRT may improve survival in Oligometastases with **High Doses** (BED >100)
- Best responders to immunotherapy (minority) have **low disease low tumor burden, Type 1 INF PDL-1 positive (checkpoints),** and high **Tumor Mutational Burden**
- SBRT modulates immune pathways through Type-1 Interferon, Innate and Adaptive immune function, and DNA repair
- SBRT may turn patients from **“cold” to “hot”** and respond to immunotherapy -> Immunotherapy may improve local control **assuming some portion receives high BED** (NRG BR001/BR002/Lu002)
