Accuracy Requirements and Uncertainties in Radiation Therapy: A Preview of an Upcoming IAEA Report

The comprehensiveness of the new IAEA report is summarized by the table of contents of the most recent draft. It addresses all the steps in the radiation treatment process for both external beam radiation therapy and brachytherapy.

1. Introduction
2. The radiation therapy process
3. Definitions and terminology
4. Accuracy requirements: Radiobiological and medical considerations
   4.1 Radiobiological framework for considering accuracy requirements
   4.2 Description of dose-response curves
   4.3 The influence of accuracy on treatment outcome
   4.4 Summary of radiobiological considerations
   4.5 Statistical considerations of accuracy needed for clinical studies
   4.6 Clinical framework for considering accuracy requirements
5. Levels of accuracy practically achievable
   5.1 Reference dosimetry
   5.2 Relative dosimetry and dose calculation
   5.3 Patient positioning and immobilisation
   5.4 Imaging systems
   5.5 Treatment delivery
   5.6 Combined accuracy considerations
6. Managing uncertainty
   6.1 Quality management versus managing quality
   6.2 Cost-benefit
   6.3 Clinical Trials
   6.4 Research
   6.5 Determining uncertainties in the clinic
   6.6 Presentation of uncertainties
   6.7 Reducing uncertainties
   6.8 Clinical audits in radiation oncology
7. Summary and Recommendations
8. References
9. Glossary
10. Abbreviations
11. Contributors to drafting and review
