---

## New Generation of Medical Accelerators

- Varian TruBeam
- Elekta evolving line of digital accelerators, from 1987
- Integrated digital control
  - Radiation – energy, delivery time, dose rate, FFF
  - New MLC --- position, speed, head rotation
  - Gantry – rotation, speed
  - Table --- position, motion (*disabled*)

---

---

---

---

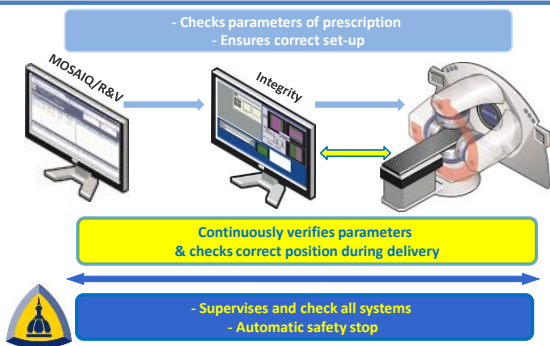

---

---

---

---

### Digital Control ensures Safety and Accuracy

---

---

---

---

---

---

---

---

---

---

### Implementation Issues

- The new Elekta VersaHD with Agility MLC
  - Dosimetric characteristics
  - Geometric accuracy
  - Achieving the next level of Quality, Safety and Efficiency

---

---

---

---

---

---

---

---

---

---

### PDD: VersaEB1, Infinity1, Sibley Agility

Standard depth doses (without FFF) well matched across accelerators with different heads

---

---

---

---

---

---

---

---

---

---

### FFF and Beam Quality

- Flattening filter removal leads to a softer beam
  - 6 MV → 4 MV
  - 10 MV → 8 MV

---

---

---

---

---

---

---

---

---

---

### FFF and Beam Quality

- For Elekta, the energy of the beam is tuned to achieve similar depth dose profiles for both flattened and FFF beams

---

---

---

---

---

---

---

---

---

---

### Softer PDD at larger field size

---

---

---

---

---

---

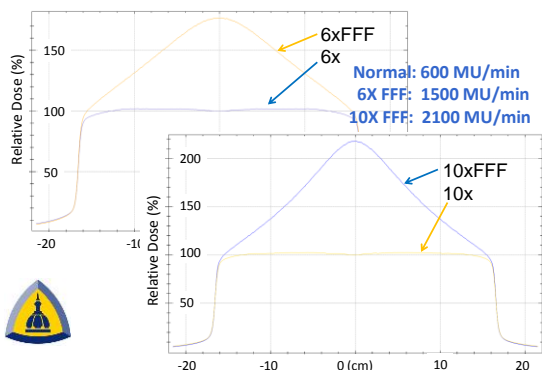

---

---

---

---

### FF vs. FFF - Profile

---

---

---

---

---

---

---

---

### VersaHD Linac Acceptance

- Dosimetry
  - Scan data ✓
    - Photon PDD, profile (90cm SSD/10cm depth)
    - Electron PDD, profile (100cm SSD/ R85/2 depth)
  - Point measurement ✓
    - TG51 (2 individual sets to confirm output)
    - TMR measurement
    - Wedge factor
  - Dose repeatability test (at different gantry angle) ✓
  - Dose linearity test (vs. MU) ✓
  - Dose rate linearity test ✓

---

---

---

---

---

---

---

---

### High Definition Agility MLC

- 160 inter-digitating leaves, 5mm at isocenter,
- 3.5 cm/s leaf motion; 6.5 cm/s integrated with leaf guide
- MLC ruby reflector (UV source) – eliminates gravity effect

---

---

---

---

---

---

---

---

## Integration of VersaHD and Agility

- Dose rate; leaf, diaphragm and Gantry speeds are
  - automatically selected by the control system to deliver the prescribed dose intensity and comply with machine constraints
  - changed 'on the fly' during the field delivery to minimize radiation interruption and unexpected 'beam hold offs'
  - Integrated to achieve minimum delivery time and optimal plan quality

## Automatic dose rate selection: Elekta and TruBeam

## The Congruence and Integrity of Radiation/Mechanical Setup

- *The fundamentals of accurate treatment,*
  - *Initial alignment of radiation isocenters with mechanical setup --- the birthmark*
- Traditional setup
  - Installers: setup to a mechanical isocenter;
  - Physicists: treat to the radiation isocenter
- Traditional tests
  - Mechanical measurements
    - Gantry; Collimator, Table, .... Readout,..etc
    - Light field Vs. Radiation field congruency,
    - .....

Traditional Evaluation of Radiation Isocenter(s)

- For each energy, each mechanical component is characterized by its own radiation isocenter; within a 1 mm "circle of confusion"
- *Inconvenient Truth: radiation isocenter(s) is typically accepted at one single energy for the major vendors.*
- The physicist should measure and tune the radiation isocenters for all x-ray energies

---

---

---

---

---

---

---

---

---

---

VersaHD: BB tool with EPID  
Alignment of the multiple radiation isocenters with EPID

- Determine the radiation isocenter based on EPID images the BB with a combination of 4 cardinal gantry & 2 collimator angles for 6X (<0.1 mm accuracy).
- Compare the radiation isocenter of other energies (10x, 15x, 6xFFF, and 10xFFF) with 6x.

---

---

---

---

---

---

---

---

---

---

Alignment results with adjustment at acceptance

(mm)	6x	10x	15x	6x FFF	10x FFF
AB (x) toward A	0.05	0.05	0.01	0.04	0.07
GT (y) toward T	0.03	0.12	0.23	0.16	0.99
UP-down (z) up	0.01	0.07	0.1	0.03	0.08
3D shift w.r.t 6x	0	0.11	0.28	0.19	0.96

---

---

---

---

---

---

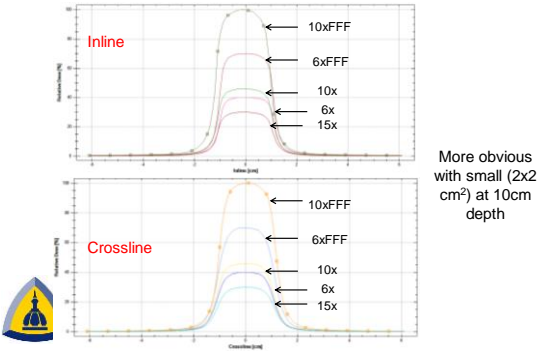

---

---

---

---

Radiation isocenter offset on beam profiles

---

---

---

---

---

---

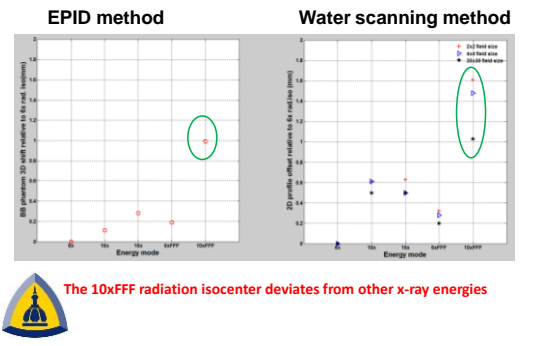

---

---

Radiation Isocenters before beam tuning

---

---

---

---

---

---

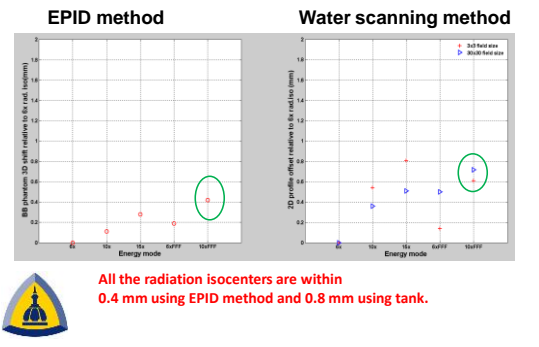

---

---

Radiation Isocenters after beam tuning

---

---

---

---

---

---

---

---

Table isocentricity is a function of gantry isocenter

Energy	Max Table Isocenter Deviation
6x	0.42 mm
10x	0.63 mm
15x	0.54 mm
6xFFF	0.37 mm
10xFFF	0.91 mm

Baseline For Monthly QA

---

---

---

---

---

---

---

---

---

---

Table isocentricity is a function of gantry isocenter

The shift between radiation isocenters of 6 and 10 MV linearly correlates with the deviation of table rotation axis from 10 MV radiation isocenter

---

---

---

---

---

---

---

---

---

---

Winston-Lutz Test

- Always a final end-to end IGRT run ( to include RTP)
- Overall position accuracy taken into account gantry, collimator and table movement
- Test was performed with EPID
- Baseline

1.1	T0G0	1.2	T0G0C180
2.1	T0G0C90	2.2	T0G0C270
3.1	T0G90	3.2	T0G90C180
4.1	T0G180	4.2	T0G180C180
5.1	T0G270	5.2	T0G270C180

---

---

---

---

---

---

### Conclusions

- The new generation of digital accelerators offers improvement in quality, safety and efficiency to deliver radiation treatment
- The acceptance process should be used to establish the "best" baseline performance of the accelerator
- The increased capabilities also imply increased QA tasks
  - New generation of QA devices and methodologies are needed
- The next level of quality, safety and efficiency needs to consider the entire delivery process in addition to the performance of the machine

---

---

---

---

---

---

---

---

---

---

### Beyond the digital accelerator

- Identify ID (RFID) and IO (Optical)

---

---

---

---

---

---

---

---

---

---

### New QA tools (minimize room entry)

---

---

---

---

---

---

---

---

---

---

iQM --- Integral Quality Monitor (from PMH and iRT)

An integral quality monitoring system for real-time verification of intensity modulated radiation therapy. Islam et al. Med. Phys. 36, 2009; US patent 8119978

*Thank you !*

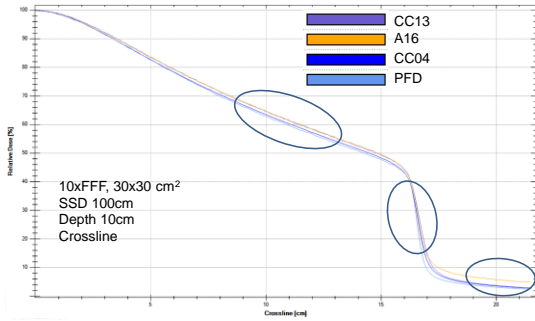

Photon Beams – Profile (FFF beam)

- Symmetry is defined the same the FF beam.
- Specify relative dose at different points of measurement (20%, 50% and 80% of the half field width), 10 x 10 and 30 x 30 cm<sup>2</sup> ( ± 3% tolerance)

**Other Issue: Choice of Detector for FFF Beams**

---

---

---

---

---

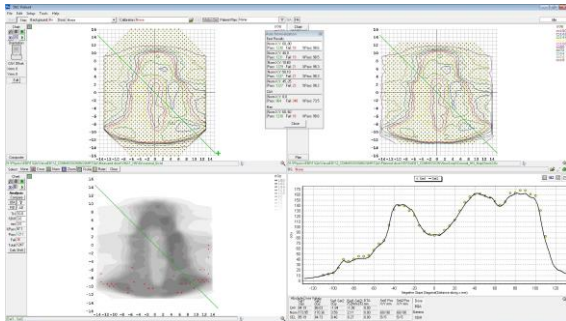

---

---

---

**Other task: VMAT Delivery Test**

HN, Coronal, 3%/3mm DTA criteria, AD passing rate: 97.1%
