

Uncertainty and Sensitivity Analysis of Biological Modeling in Proton and Carbon Ion Treatment Planning

Department of Radiation Oncology
July 14, 2020 | Dr. Florian Kamp

Disclaimer

- Research and development funds from ViewRay

Learning objectives

- Linear-quadratic model as basis for RBE modeling
 - Parameters
 - Isoeffective RBE definition
- Differences in RBE modeling between proton and carbon ions
 - Fragmentation
 - RBE prediction for carbon ions
- Uncertainties in RBE modeling
 - Origin, impact and analysis
 - Variance-based uncertainty and sensitivity analysis

C⁶⁺

p⁺

Relative biological effectiveness (RBE)

C⁶⁺
(p⁺)

Linear-quadratic (LQ) model:

$$S(d) = \exp(-\alpha d - \beta d^2)$$

Relative biological effectiveness:

$$RBE = \frac{d_x}{d_p} \Big|_{S=\text{const}}$$

$$RBE = \frac{-\alpha_x + \sqrt{\alpha_x^2 + 4d_p\beta_x(\alpha_p + \beta_p d_p)}}{2\beta_x d_p}$$

biological dose-response modeling:

$$\alpha_p(\alpha_x, \beta_x, Z_{ion}, LET_{ion}, cell)$$

$$\beta_p(\alpha_x, \beta_x, Z_{ion}, LET_{ion}, cell)$$

RBE-weighted dose:

$$RWD = RBE \cdot d_p$$

$$RWD = RBE(\alpha_p(\dots), \beta_p(\dots), \alpha_x, \beta_x, d_p) \cdot d_p$$

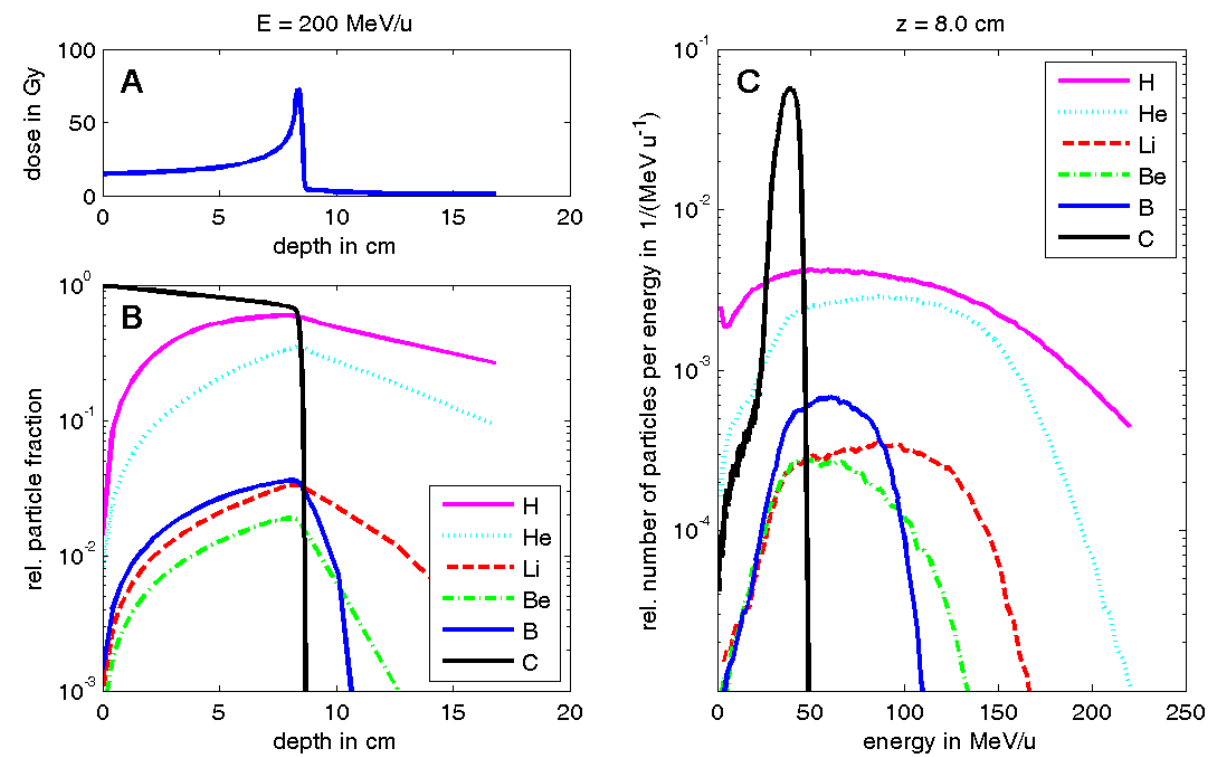

Differences between p^+ and C^{6+} Fragmentation

p^+

C^{6+}

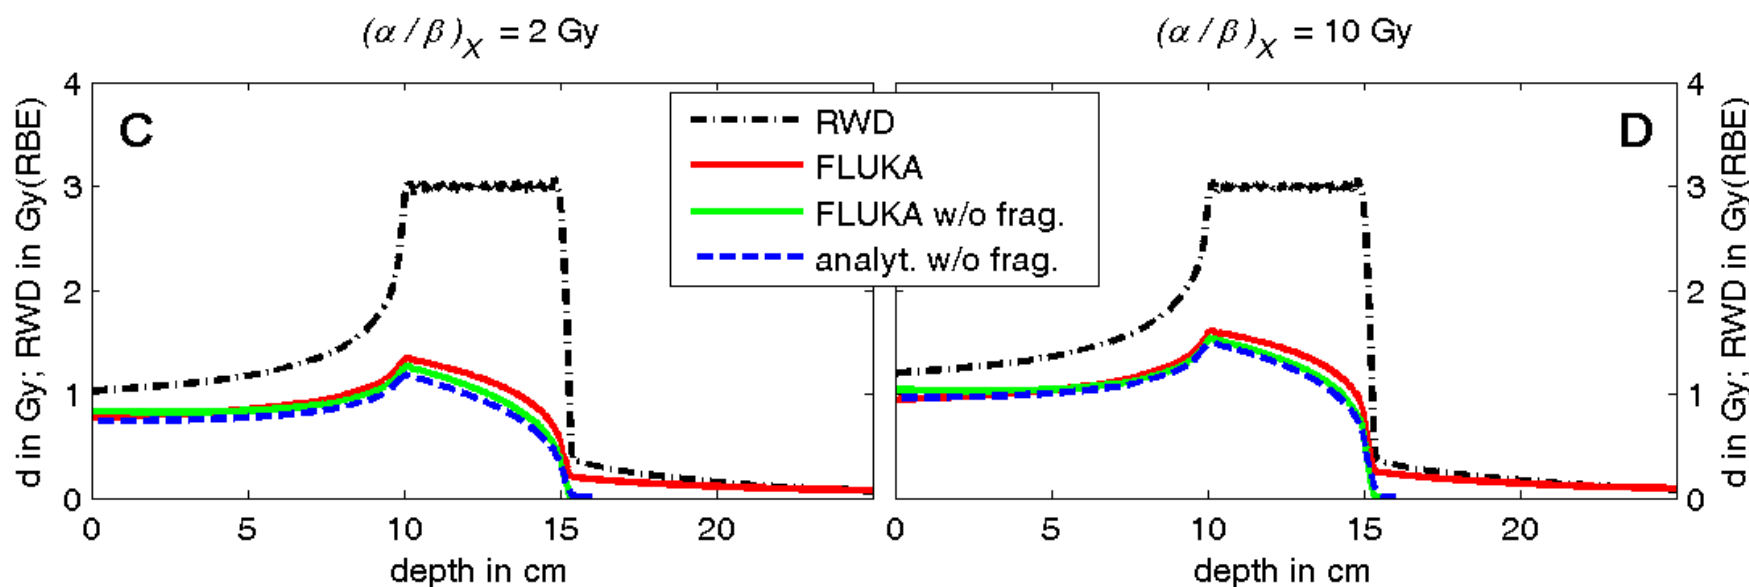

Courtesy of K. Parodi and G. Dedes, LMU Munich

Kamp et al., IJROBP 2015

Influence of fragmentation on RBE and RWD

C6+

- Accounting for fragmentation reduces RBE
- It is crucial: underestimation of needed dose of up to 30% without fragmentation
- General: RBE is a main factor for carbon ion RT

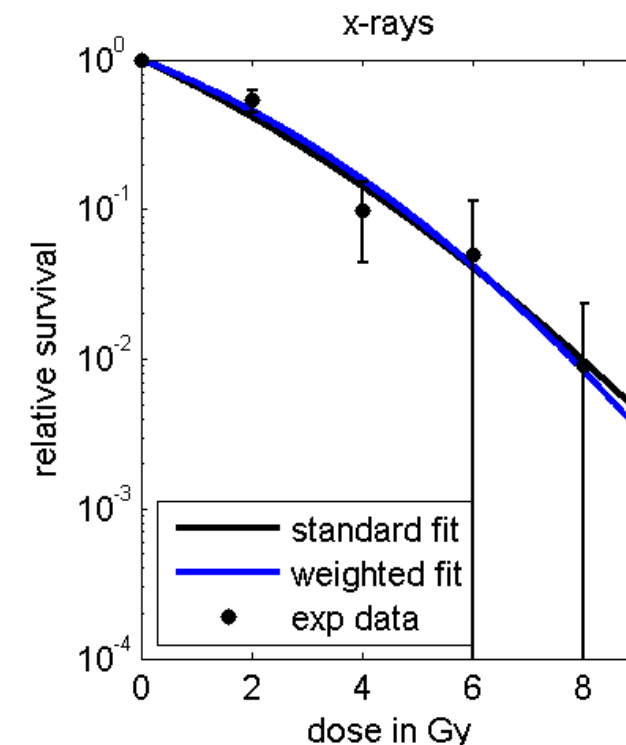

Uncertainties in RBE modeling

$$\alpha_p(\alpha_x, \beta_x, Z_{ion}, LET_{ion}, cell)$$

$$\beta_p(\alpha_x, \beta_x, Z_{ion}, LET_{ion}, cell)$$

- Many factors:
 - Determination of radiosensitivity parameters
 - Validity of the LQ-model
 - Extrapolation from in-vitro experiments to the human body
 - Uncertainties in the biological models and their parameters / assumptions
 - ...
- Every model is wrong, some are usefull*

C6+
p+

	α_x in Gy ⁻¹	β_x in Gy ⁻²
standard fit	0.397 ± 0.129	0.023 ± 0.019
weighted fit	0.323 ± 0.123	0.034 ± 0.021

68.3% confidence interval of the fit

Experimental data courtesy of D. Habermehl

*George Box, https://en.wikipedia.org/wiki/All_models_are_wrong

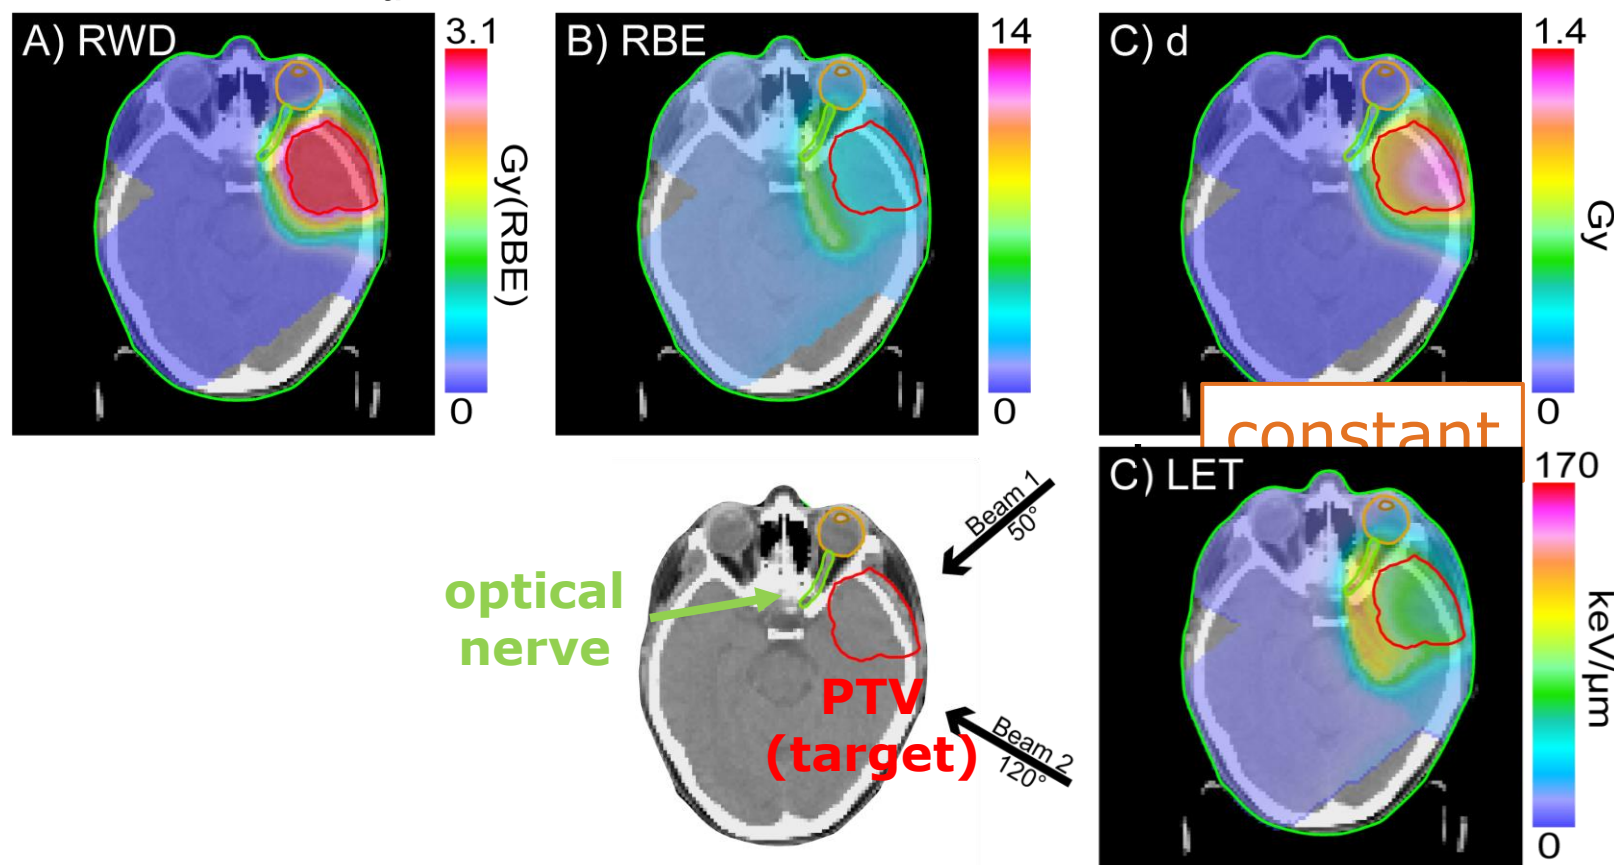

Example: Impact of uncertainties

C6+

Change one biological modeling (Σ/Σ_x) parameter by **10%**

$$RWD = RBE \cdot d$$

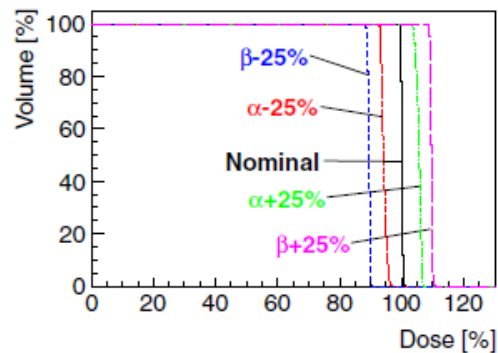

- Multi-field biological optimization with RMF model for carbon ion RT
- $(\alpha_x/\beta_x) = 2 \text{ Gy}$

5% deviation in RWD

Uncertainty and sensitivity analysis

Teaser

- All RBE model predictions are uncertain
- Uncertainty and sensitivity analysis mostly done by changing one parameter at a time in the model.

e.g. Böhlen et al., PMB 2012

- Variance-based uncertainty and sensitivity analysis to combine „physical“ uncertainties in
 - **range**
 - **setup** (isocenter shifts)
- with uncertainties in RBE prediction originating from:
 - α_X and β_X (or (α_X/β_X))
 - RBE model **input parameters**

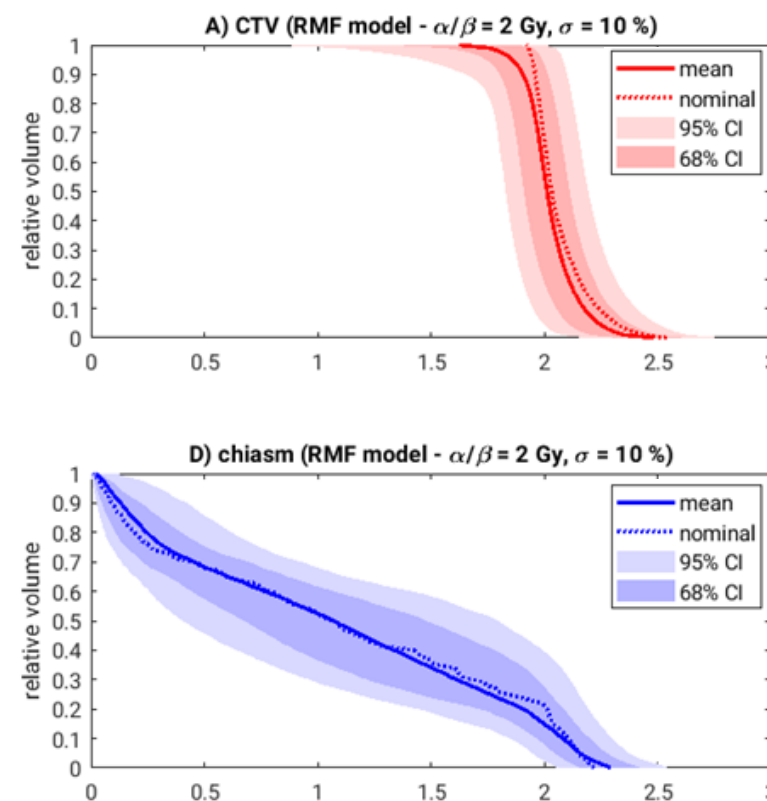

Variance-based uncertainty analysis

Add uncertainties to treatment planning

- Execute RWD calculation many times (10^3 - 10^4) with randomly and simultaneously changed:
 - Isocenter
 - Range
 - Biological model parameters

- Requirements:
 - Fast RBE model execution given changed input*
 - Fast RWD calculation

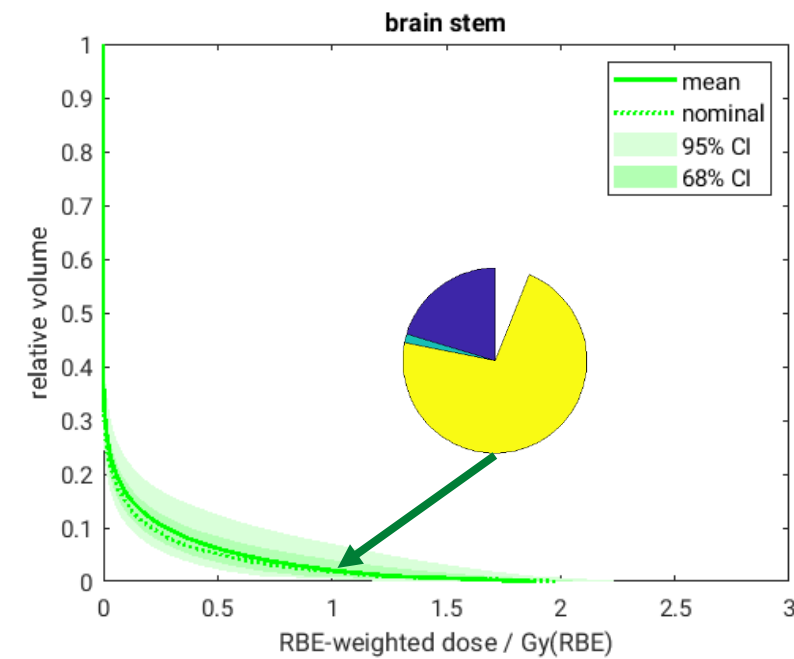

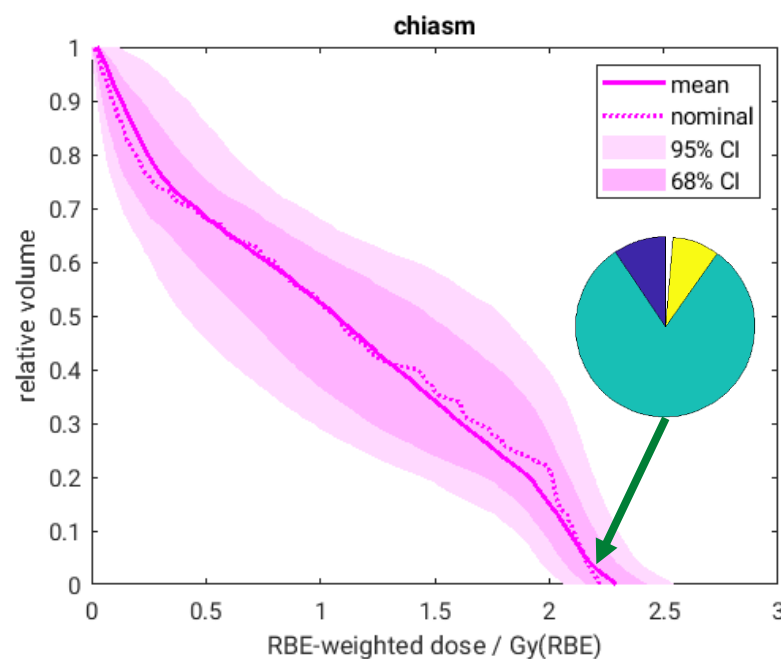

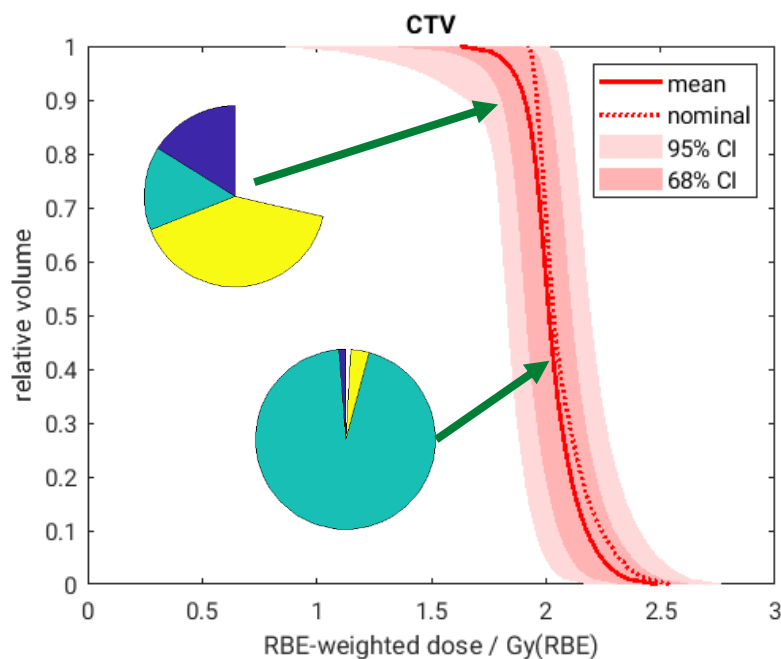

Hofmaier et al., conditionally accepted Med. Phys.

*e.g. Wedenberg et al. Acta Oncol, 2013 , or RMF model as described in Kamp et al. PMB, 2017

Variance-based sensitivity analysis

Break down resulting uncertainties into impact of the input uncertainties

Biology
Setup
Range

Missing sectors of pie chart:
Interactions between different uncertainties
